As many of you know, there has been some uncertainty pertaining to the methods and resources that are acceptable in determining design infiltration rates. The attached document is not intended to provide all the answers, however, it will provide guidance on the reliability of information, variables to be considered, and resources available.

There are ongoing efforts by both Region and Service Center to develop easier and more reliable methods of determining design infiltration rates. These efforts make revisions of this document likely. Please check with the EHS Office for the most current information.

If you have any questions or comments please contact the Olympic Region Hydraulic Engineer - Design at 357-2726.
